Replacement Tips

Will fit most door opener models!!!

All bits fit 1 1/2" drivers.

The AD-06 rail car bit has a total length of 6 inches.

It goes from 1" to 1.5" at a depth of 4 inches.

This is important as many cars only allow a 4" insertion.

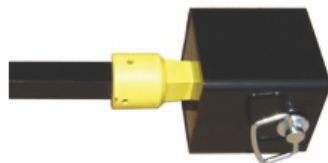

Pin Socket

This socket has square drive hole perfect for all types of door openers, not only the Door Demon.

The pin socket is used when the square drive on the railcar is worn to the point a square tool will no longer open the door.

The socket slides over the capstan and is pinned in place with a 1-inch pin to transfer the opening torque.

The oversized tube design and square drive hole makes the socket useable on almost any door and opener combination on the market.
